(54) ITEM RETRIEVING UNIT IN NAVIGATION SYSTEM.

(57)Abstract:

PURPOSE: To select a desired item through single action by inspecting an item selected in the past and one or a plurality of attributes belonging thereto at the time of retrieving an item thereby selecting an item having the same attributes as past ones.

CONSTITUTION: A navigation system 4 is connected with a wheel sensor 1 for detecting the traveling distance of a vehicle, a gyro 2 for detecting the advancing azimuth, and a GPS receiver 8 for receiving a radio wave transmitted from a GPS satellite navigating on an orbit around the globe. Outputs from the wheel sensor 1, the gyro 2 and the GPS receiver 8 are fed to a body 4 where the current position of the vehicle is detected based on these outputs. Since the GPS receiver 8 can detect the current position of the vehicle directly based on the propagation delay time of received radio wave, it can be employed in the correction of current position of vehicle determined by self-contained navigation.

LEGAL STATUS

[Date of request for examination] 30.04.1996

[Date of sending the examiner's decision of rejection]

[Kind of final disposal of application other than the examiner's decision of rejection or application converted to registration]

[Date of final disposal for application]

[Patent number] 2917856

[Date of registration] 23.04.1999

[Number of appeal against examiner's decision of rejection]

[Date of requesting appeal against examiner's decision of rejection]

[Date of extinction of right]
